Operating Conditions

MAX 10 devices are rated according to a set of defined parameters. To maintain the highest possible performance and reliability of the MAX 10 devices, you must consider the operating requirements described in this section.

Absolute Maximum Ratings

This section defines the maximum operating conditions for MAX 10 devices. The values are based on experiments conducted with the devices and theoretical modeling of breakdown and damage mechanisms. The functional operation of the device is not implied for these conditions.

Caution: Conditions outside the range listed in the absolute maximum ratings tables may cause permanent damage to the device. Additionally, device operation at the absolute maximum ratings for extended periods of time may have adverse effects on the device.

Single Supply Devices Absolute Maximum Ratings

Table 2. Absolute Maximum Ratings for MAX 10 Single Supply Devices

| Symbol | Parameter | Min | Max | Unit |

Maximum Allowed Overshoot During Transitions over a 11.4-Year Time Frame

During transitions, input signals may overshoot to the voltage listed in the following table and undershoot to -2.0 V for input currents less than 100 mA and periods shorter than 20 ns.

The maximum allowed overshoot duration is specified as a percentage of high time over the lifetime of the device. A DC signal is equivalent to 100% duty cycle.

For example, a signal that overshoots to 4.17 V can only be at 4.17 V for ~11.7% over the lifetime of the device; for a device lifetime of 11.4 years, this amounts to 1.33 years.

Table 5. Maximum Allowed Overshoot During Transitions over a 11.4-Year Time Frame for MAX 10 Devices

| Condition (V) | Overshoot Duration as % of High Time | Unit |
|---------------------|--------------------------------------|------|
| 4.12 | 100.0 | % |

Recommended Operating Conditions

This section lists the functional operation limits for the AC and DC parameters for MAX 10 devices. The tables list the steady-state voltage values expected from MAX 10 devices. Power supply ramps must all be strictly monotonic, without plateaus.

Single Supply Devices Power Supplies Recommended Operating Conditions

Table 6. Power Supplies Recommended Operating Conditions for MAX 10 Single Supply Devices

3 V_{CCIO} for all I/O banks must be powered up during user mode because V_{CCIO} I/O banks are used for the ADC and I/O functionalities.

4 All V_{CCA} pins must be powered to 2.5 V (even when PLLs are not used), and must be powered up and powered down at the same time.

5 V_{CCD_PLL} must always be connected to V_{CC} through a decoupling capacitor and ferrite bead.

Programming/Erasure Specifications

Table 9. Programming/Erasure Specifications for MAX 10 Devices

This table shows the programming cycles and data retention duration of the user flash memory (UFM) and configuration flash memory (CFM) blocks.

6 −40°C is only applicable to Start of Test, when the device is powered-on. The device does not stay at the minimum junction temperature for a long time.

7 There is no absolute minimum value for the ramp time requirement. Intel characterized the minimum ramp time at 200 µs.

For more information about data retention duration with 10,000 programming cycles for automotive temperature devices, contact your Intel quality representative.

DC Characteristics

Supply Current and Power Consumption

Intel offers two ways to estimate power for your design—the Excel-based Early Power Estimator (EPE) and the Quartus Prime Power Analyzer feature.

Use the Excel-based EPE before you start your design to estimate the supply current for your design. The EPE provides a magnitude estimate of the device power because these currents vary greatly with the usage of the resources.

The Quartus Prime Power Analyzer provides better quality estimates based on the specifics of the design after you complete place-and-route. The Power Analyzer can apply a combination of user-entered, simulation-derived, and estimated signal activities that, when combined with detailed circuit models, yield very accurate power estimates.

I/O Pin Leakage Current

The values in the table are specified for normal device operation. The values vary during device power-up. This applies for all V_{CCIO} settings (3.3, 3.0, 2.5, 1.8, 1.5, 1.35, and 1.2 V).

10 μ A I/O leakage current limit is applicable when the internal clamping diode is off. A higher current can be observed when the diode is on.

⁸ The number of E/P cycles applies to the smallest possible flash block that can be erased or programmed in each MAX 10 device. Each MAX 10 device has multiple flash pages per device.

Input channel leakage of ADC I/O pins due to hot socket is up to maximum of 1.8 mA. The input channel leakage occurs when the ADC IP core is enabled or disabled. This is applicable to all MAX 10 devices with ADC IP core, which are 10M04, 10M08, 10M16, 10M25, 10M40, and 10M50 devices. The ADC I/O pins are in Bank 1A.

Bus Hold Parameters

Bus hold retains the last valid logic state after the source driving it either enters the high impedance state or is removed. Each I/O pin has an option to enable bus hold in user mode. Bus hold is always disabled in configuration mode.

**OCT Variation after Calibration at Device Power-Up**

The OCT resistance may vary with the variation of temperature and voltage after calibration at device power-up.

Use the following table and equation to determine the final OCT resistance considering the variations after calibration at device power-up.

Table 15. OCT Variation after Calibration at Device Power-Up for MAX 10 Devices

This table lists the change percentage of the OCT resistance with voltage and temperature.

| Description | Nominal Voltage | dR/dT (%/°C) | dR/dV (%/mV) |
|--|-----------------|--------------|--------------|
| OCT variation after calibration at device power-up | 3.00 | 0.25 | -0.027 |
| | 2.50 | 0.245 | -0.04 |
| | 1.80 | 0.242 | -0.079 |

Figure 1. Equation for OCT Resistance after Calibration at Device Power-Up

$$\Delta R_V = (V_2 - V_1) \times 1000 \times dR/dV$$

$$\Delta R_T = (T_2 - T_1) \times dR/dT$$

$$\text{For } \Delta R_X < 0; MF_X = 1/(|\Delta R_X|/100 + 1)$$

$$\text{For } \Delta R_X > 0; MF_X = \Delta R_X/100 + 1$$

$$MF = MF_V \times MF_T$$

$$R_{final} = R_{initial} \times MF$$

The definitions for equation are as follows:

- T_1 is the initial temperature.
- T_2 is the final temperature.
- MF is multiplication factor.
- R_{initial} is initial resistance.
- R_{final} is final resistance.
- Subscript x refers to both V and T.
- ΔR_V is variation of resistance with voltage.
- ΔR_T is variation of resistance with temperature.
- dR/dT is the change percentage of resistance with temperature after calibration at device power-up.
- dR/dV is the change percentage of resistance with voltage after calibration at device power-up.
- V_1 is the initial voltage.
- V_2 is final voltage.

The following figure shows the example to calculate the change of 50 Ω I/O impedance from 25°C at 3.0 V to 85°C at 3.15 V.

Figure 2. Example for OCT Resistance Calculation after Calibration at Device Power-Up

$$\Delta R_V = (3.15 - 3) \times 1000 \times -0.027 = -4.05$$

$$\Delta R_T = (85 - 25) \times 0.25 = 15$$

Because ΔR_V is negative,

$$MF_V = 1/(4.05/100 + 1) = 0.961$$

Because ΔR_T is positive,

$$MF_T = 15/100 + 1 = 1.15$$

$$MF = 0.961 \times 1.15 = 1.105$$

$$R_{final} = 50 \times 1.105 = 55.25\Omega$$

Pin Capacitance

Table 16. Pin Capacitance for MAX 10 Devices

| Symbol | Parameter | Maximum | Unit |

Internal Weak Pull-Up Resistor

All I/O pins, except configuration, test, and JTAG pins, have an option to enable weak pull-up.

Table 17. Internal Weak Pull-Up Resistor for MAX 10 Devices

Pin pull-up resistance values may be lower if an external source drives the pin higher than V_{CCIO}.

| Symbol | Parameter | Condition | Min | Typ | Max | Unit |
|-----------------|---|--------------------------------|-----|-----|-----|------|
| R _{PU} | Value of I/O pin (dedicated and dual-purpose) pull-up resistor before and during configuration, as well as user mode if the programmable pull-up resistor option is enabled | V _{CCIO} = 3.3 V ± 5% | 7 | 12 | 34 | kΩ |

| | | V _{CCIO} = 1.8 V ± 5% | 16 | 25 | 75 | kΩ |
| | | V _{CCIO} = 1.5 V ± 5% | 20 | 36 | 106 | kΩ |
| | | V _{CCIO} = 1.2 V ± 5% | 33 | 82 | 179 | kΩ |

Hot-Socketing Specifications

Table 18. Hot-Socketing Specifications for MAX 10 Devices

| Symbol | Parameter | Maximum |
|------------------------|------------------------|--------------------|
| I _{IOPIN(DC)} | DC current per I/O pin | 300 μA |
| I _{IOPIN(AC)} | AC current per I/O pin | 8 mA ¹³ |

¹¹ When V_{REF} pin is used as regular input or output, F_{max} performance is reduced due to higher pin capacitance. Using the V_{REF} pin capacitance specification from device datasheet, perform SI analysis on your board setup to determine the F_{max} of your system.

¹² 10M40 and 10M50 devices have dual purpose clock input pins at top/bottom I/O banks.

Hysteresis Specifications for Schmitt Trigger Input

MAX 10 devices support Schmitt trigger input on all I/O pins. A Schmitt trigger feature introduces hysteresis to the input signal for improved noise immunity, especially for signal with slow edge rate.

Table 19. Hysteresis Specifications for Schmitt Trigger Input for MAX 10 Devices

| Symbol | Parameter | Condition | Minimum | Unit |
|------------------|--------------------------------------|---------------------------|---------|------|
| V _{HYS} | Hysteresis for Schmitt trigger input | V _{CCIO} = 3.3 V | 180 | mV |
| | | V _{CCIO} = 2.5 V | 150 | mV |
| | | V _{CCIO} = 1.8 V | 120 | mV |
| | | V _{CCIO} = 1.5 V | 110 | mV |

-
- 13 The I/O ramp rate is 10 ns or more. For ramp rates faster than 10 ns, $|I_{IOPIN}| = C \, dv/dt$, in which C is I/O pin capacitance and dv/dt is the slew rate.

**Figure 3. LVTTL/LVCMOS Input Standard Voltage Diagram**

Figure 4. Schmitt Trigger Input Standard Voltage Diagram

I/O Standards Specifications

Tables in this section list input voltage (V_{IH} and V_{IL}), output voltage (V_{OH} and V_{OL}), and current drive characteristics (I_{OH} and I_{OL}) for various I/O standards supported by MAX 10 devices.

For minimum voltage values, use the minimum V_{CCIO} values. For maximum voltage values, use the maximum V_{CCIO} values.

You must perform timing closure analysis to determine the maximum achievable frequency for general purpose I/O standards.

Single-Ended I/O Standards Specifications

Table 20. Single-Ended I/O Standards Specifications for MAX 10 Devices

To meet the I_{OL} and I_{OH} specifications, you must set the current strength settings accordingly. For example, to meet the 3.3-V LVTTTL specification (4 mA), you should set the current strength settings to 4 mA. Setting at lower current strength may not meet the I_{OL} and I_{OH} specifications in the datasheet.

| I/O Standard | V_{CCIO} (V) | | | V_{IL} (V) | | V_{IH} (V) | | V_{OL} (V) | V_{OH} (V) | I_{OL} (mA) | I_{OH} (mA) |

16 Value shown refers to AC input reference voltage, V_{REF(AC)}.

Single-Ended SSTL, HSTL, and HSUL I/O Standards Signal Specifications

Table 22. Single-Ended SSTL, HSTL, and HSUL I/O Standards Signal Specifications for MAX 10 Devices

To meet the I_{OL} and I_{OH} specifications, you must set the current strength settings accordingly. For example, to meet the SSTL-15 Class I specification (8 mA), you should set the current strength settings to 8 mA. Setting at lower current strength may not meet the I_{OL} and I_{OH} specifications in the datasheet.

Differential HSTL and HSUL I/O Standards Specifications

Differential HSTL requires a V_{REF} input.

¹⁷ The maximum value for V_{SWING(DC)} is not defined. However, each single-ended signal needs to be within the respective single-ended limits (V_{IH(DC)} and V_{IL(DC)}).

¹⁸ V_{IN} range: 0 V ≤ V_{IN} ≤ 1.85 V.

¹⁹ R_L range: 90 ≤ R_L ≤ 110 Ω.

²⁰ Low V_{OD} setting is only supported for RSDS standard.

²² No fixed V_{IN}, V_{OD}, and V_{OS} specifications for Bus LVDS (BLVDS). They are dependent on the system topology.

²³ Mini-LVDS, RSDS, and Point-to-Point Differential Signaling (PPDS) standards are only supported at the output pins for MAX 10 devices.

²⁴ Supported with requirement of an external level shift

²⁵ Sub-LVDS input buffer is using 2.5 V differential buffer.

²⁶ Differential output depends on the values of the external termination resistors.

²⁷ Differential output offset voltage depends on the values of the external termination resistors.

- 29 The VCO frequency reported by the Quartus Prime software in the PLL summary section of the compilation report takes into consideration the VCO post-scale counter K value. Therefore, if the counter K has a value of 2, the frequency reported can be lower than the f_{VCO} specification.
- 30 A high input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean clock source, which is less than 200 ps.
- 31 Peak-to-peak jitter with a probability level of 10^{-12} (14 sigma, 99.9999999974404% confidence level). The output jitter specification applies to the intrinsic jitter of the PLL, when an input jitter of 30 ps is applied.

Periphery Performance Specifications

This section describes the periphery performance, high-speed I/O, and external memory interface.

Actual achievable frequency depends on design and system specific factors. Ensure proper timing closure in your design and perform HSPICE/IBIS simulations based on your specific design and system setup to determine the maximum achievable frequency in your system.

High-Speed I/O Specifications

For more information about the high-speed and low-speed I/O performance pins, refer to the respective device pin-out files.

[External Memory Interface Spec Estimator](#)

Provides the specific details of the memory standards supported.

⁷² TX jitter is the jitter induced from core noise and I/O switching noise.

⁷³ MAX 10 devices support only single-die LPDDR2.

⁷⁴ To achieve the specified performance, constrain the memory device I/O and core power supply variation to within $\pm 3\%$. By default, the frequency is 167 MHz.

Memory Output Clock Jitter Specifications

MAX 10 devices support external memory interfaces up to 303 MHz. The external memory interfaces for MAX 10 devices calibrate automatically.

The memory output clock jitter measurements are for 200 consecutive clock cycles.

The clock jitter specification applies to memory output clock pins generated using DDIO circuits clocked by a PLL output routed on a PHY clock network.

DDR3 and LPDDR2 SDRAM memory interfaces are only supported on the fast speed grade device.

I/O Timing

The data is typically used prior to designing the FPGA to get an estimate of the timing budget as part of the link timing analysis.

The Quartus Prime Timing Analyzer provides a more accurate and precise I/O timing data based on the specific device and design after you complete place-and-route.

Table 56. I/O Timing for MAX 10 Devices

These I/O timing parameters are for the 3.3-V LVTTTL I/O standard with the maximum drive strength and fast slew rate for 10M08DAF484 device.

Glossary

Table 59. Glossary

| Term | Definition |
|--|---|
| R _L | Receiver differential input discrete resistor (external to MAX 10 devices). |
| RSKM (Receiver input skew margin) | HIGH-SPEED I/O block: The total margin left after accounting for the sampling window and TCCS. $RSKM = (TUI - SW - TCCS) / 2$. |
| Sampling window (SW) | HIGH-SPEED I/O Block: The period of time during which the data must be valid to capture it correctly. The setup and hold times determine the ideal strobe position in the sampling window. |
| Single-ended voltage referenced I/O standard | The AC input signal values indicate the voltage levels at which the receiver must meet its timing specifications. The DC input signal values indicate the voltage levels at which the final logic state of the receiver is unambiguously defined. After the receiver input crosses the AC value, the receiver changes to the new logic state. The new logic state is then maintained as long as the input stays beyond the DC threshold. This approach is intended to provide predictable receiver timing in the presence of input waveform ringing. |
| t _c | High-speed receiver/transmitter input and output clock period. |
| TCCS (Channel-to-channel-skew) | HIGH-SPEED I/O block: The timing difference between the fastest and slowest output edges, including t _{CO} variation and clock skew. The clock is included in the TCCS measurement. |
| t _{cin} | Delay from clock pad to I/O input register. |
| t _{CO} | Delay from clock pad to I/O output. |

| Term | Definition |
|--------------------------------|--|
| t_{cout} | Delay from clock pad to I/O output register. |
| t_{DUTY} | HIGH-SPEED I/O Block: Duty cycle on high-speed transmitter output clock. |
| t_{FALL} | Signal high-to-low transition time (80–20%). |
| t_{H} | Input register hold time. |
| Timing Unit Interval (TUI) | HIGH-SPEED I/O block: The timing budget allowed for skew, propagation delays, and data sampling window. (TUI = $1/(\text{Receiver Input Clock Frequency Multiplication Factor}) = t_{\text{C}}/w$). |
| t_{INJITTER} | Period jitter on PLL clock input. |
| $t_{\text{OUTJITTER_DEDCLK}}$ | Period jitter on dedicated clock output driven by a PLL. |
| $t_{\text{OUTJITTER_IO}}$ | Period jitter on general purpose I/O driven by a PLL. |
| t_{pIICin} | Delay from PLL inclk pad to I/O input register. |
| t_{pIICout} | Delay from PLL inclk pad to I/O output register. |
| t_{RISE} | Signal low-to-high transition time (20–80%). |
| t_{SU} | Input register setup time. |
| $V_{\text{CM(DC)}}$ | DC common mode input voltage. |
| $V_{\text{DIF(AC)}}$ | AC differential input voltage: The minimum AC input differential voltage required for switching. |
| $V_{\text{DIF(DC)}}$ | DC differential input voltage: The minimum DC input differential voltage required for switching. |
| V_{HYS} | Hysteresis for Schmitt trigger input. |
| V_{ICM} | Input common mode voltage: The common mode of the differential signal at the receiver. |
| V_{ID} | Input differential Voltage Swing: The difference in voltage between the positive and complementary conductors of a differential transmission at the receiver. |
| V_{IH} | Voltage input high: The minimum positive voltage applied to the input which is accepted by the device as a logic high. |
| $V_{\text{IH(AC)}}$ | High-level AC input voltage. |
| $V_{\text{IH(DC)}}$ | High-level DC input voltage. |
| V_{IL} | Voltage input low: The maximum positive voltage applied to the input which is accepted by the device as a logic low. |
| $V_{\text{IL (AC)}}$ | Low-level AC input voltage. |
| $V_{\text{IL (DC)}}$ | Low-level DC input voltage. |

| V_{IN} | DC input voltage. |
| V_{OCM} | Output common mode voltage: The common mode of the differential signal at the transmitter. |
| V_{OD} | Output differential voltage swing: The difference in voltage between the positive and complementary conductors of a differential transmission line at the transmitter. $V_{OD} = V_{OH} - V_{OL}$. |
| V_{OH} | Voltage output high: The maximum positive voltage from an output which the device considers is accepted as the minimum positive high level. |
| V_{OL} | Voltage output low: The maximum positive voltage from an output which the device considers is accepted as the maximum positive low level. |
| V_{OS} | Output offset voltage: $V_{OS} = (V_{OH} + V_{OL}) / 2$. |
| $V_{OX (AC)}$ | AC differential Output cross point voltage: The voltage at which the differential output signals must cross. |
| V_{REF} | Reference voltage for SSTL, HSTL, and HSUL I/O Standards. |
| $V_{REF(AC)}$ | AC input reference voltage for SSTL, HSTL, and HSUL I/O Standards. $V_{REF(AC)} = V_{REF(DC)} + \text{noise}$. The peak-to-peak AC noise on V_{REF} should not exceed 2% of $V_{REF(DC)}$. |
| $V_{REF(DC)}$ | DC input reference voltage for SSTL, HSTL, and HSUL I/O Standards. |
| $V_{SWING (AC)}$ | AC differential input voltage: AC Input differential voltage required for switching. |
| $V_{SWING (DC)}$ | DC differential input voltage: DC Input differential voltage required for switching. |
| V_{TT} | Termination voltage for SSTL, HSTL, and HSUL I/O Standards. |
| $V_X (AC)$ | AC differential Input cross point voltage: The voltage at which the differential input signals must cross. |
